Senior Research Manager
Natural Resources Solutions,
IBM Research | Brazil

“By 2018, 75% of all Oil and Gas companies will have at least one digital transformation initiative in full operation deploying cloud, big data and analytics, process automation, or IoT for the organization to advance their IT environment”

Source: IDC FutureScape: Worldwide Oil and Gas 2018 Predictions, December 2017

Digital transformation is addressing key industry challenges

Cloud & Data

IoT

AI/Cognitive

Blockchain

Developing new solutions for E&P to accelerate improved decision making with greater certainty

Optimizing supply chain and capital usage through secure transactions

Leveraging insights to drive safe, efficient and effective operations

Driving sales through both systematic and unsystematic customer insight

Delivering superior customer service through multi channel experiences

AI, a business imperative for Natural Resources Industries

Rapid analysis of massive volumes of divergent data

Fact based, traceable hypothesis/reasoning

Insight and expertise retained within the company

Accelerates improved decision making with greater certainty

Democratize innovation by scaling knowledge

Towards Broad AI in E&P

Transform the industry's knowledge intensive processes that rely on data interpretation to understand the subsurface

New ventures & appraisals

Exploration

Field development

Production and Operations

Asset Optimization

Main sources of information and knowledge

seismic data

well log data & core samples

technical literature

experts' tacit knowledge

Challenges for AI in O&G

Small Data

Transfer Learning

Explainability

AI for NR Industry Approach

AI Technologies + Knowledge Representation/Modeling + Domain & Context Understanding

Practice & Context Understanding

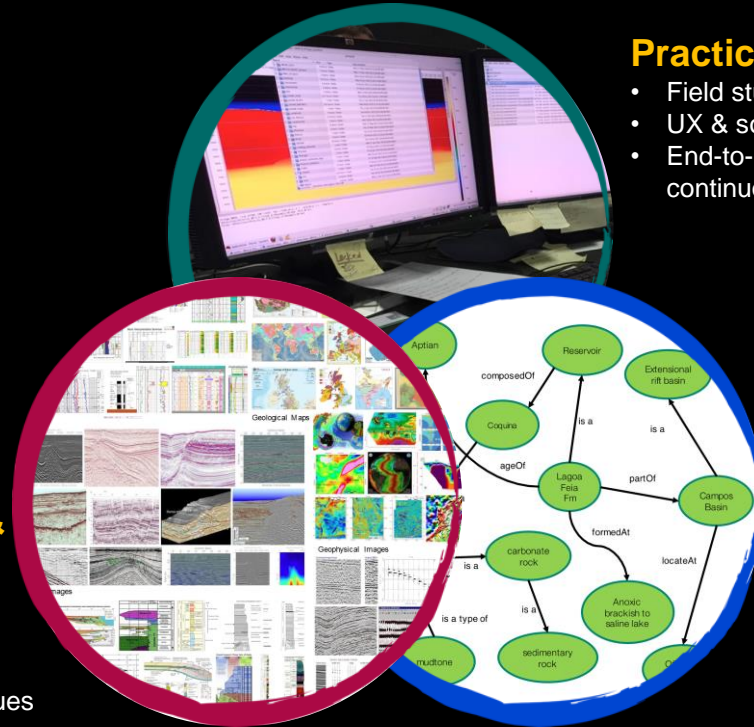

- Field studies of expert decision-making processes
- UX & solution integration of work practices
- End-to-end AI Solutions lifecycle support for continuous learning

AI Technologies for Vision & Data-Driven Models

- Deep-learning for Seismic Image Understanding
- Machine-learning for geo-special data
- Machine-learning for Reservoir Analogues
- Data-driven well-logs analytics
- AI for Model-blending: physical-based and data-based model integration

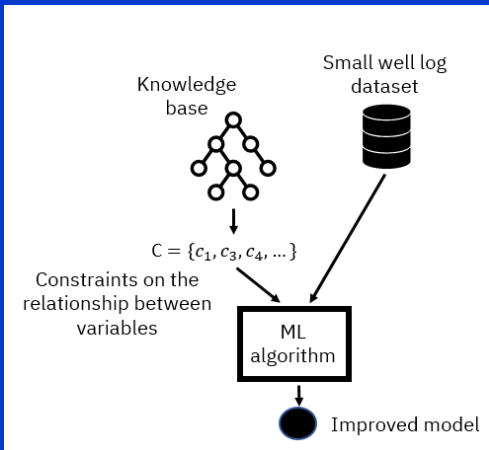

Fit-for-purpose Knowledge Engineering

- Construction and evolution of domain ontologies
- Improved interpretability and causal analysis
- Training with small data
- Hyper-knowledge: KR + multi-categorical data
- NR Knowledge extraction & representation from documents

Small Data

- **Data Augmentation**
 - Knowledge from analogs
 - Creation of synthetic data
- Use learning from small data set to train AI for annotation (AI 4 AI)
- Generative Adversarial Networks (GANs)

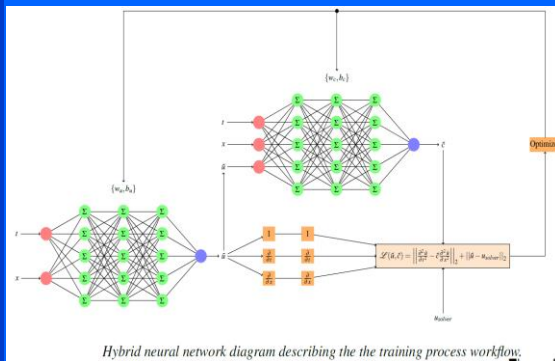

Transfer Learning

- Reuse knowledge acquired in other areas

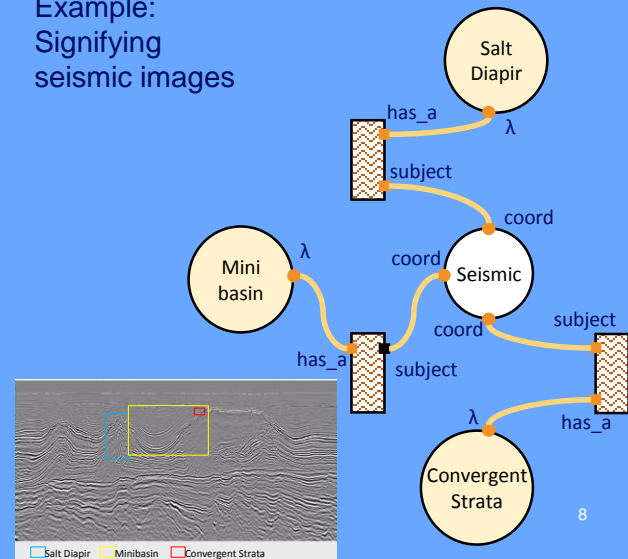

- Imbed knowledge from physical models (PiNNS)

Interpretability

- **Hyper-Knowledge Representation**
 - Extending the traditional knowledge representation techniques to connect concepts with multimodal content/representation

Example:
Signifying seismic images

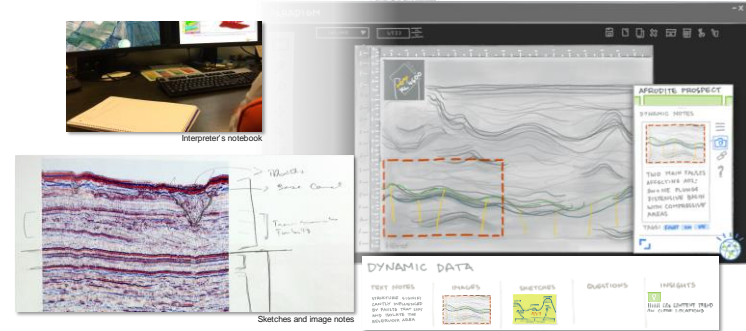

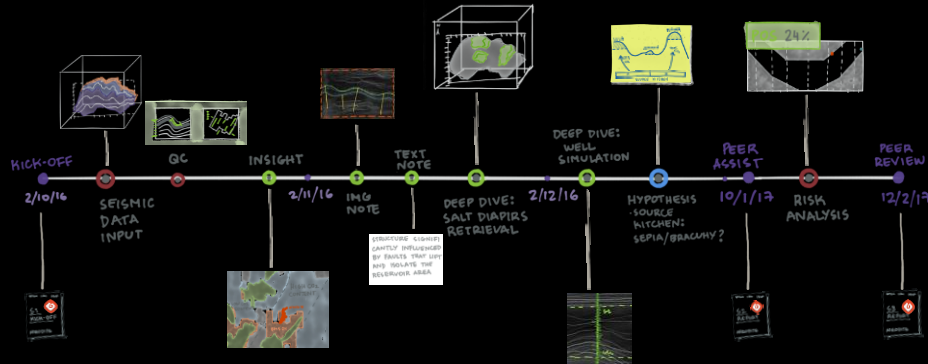

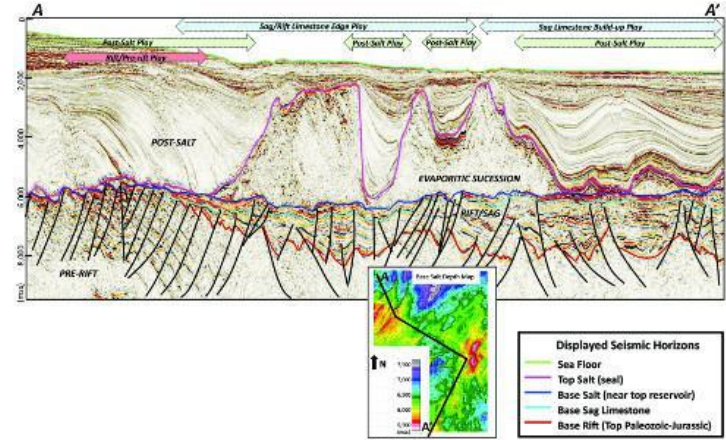

Galp Project: AI-assisted Seismic Interpretation for O&G

Seismic interpretation is the science (and art) of inferring the geology at some depth from the processed seismic record. – such as structural horizon geometry, depositional environment, sequence stratigraphy, and so on. High quality seismic interpretation is critical for the success of oil exploration and production.

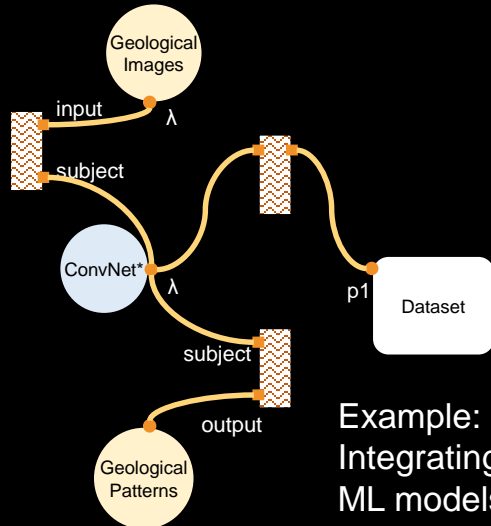

It is a very **knowledge intensive process**, in which one of the bottlenecks is the dependence on **interpreter's tacit knowledge** about the geological context. This tacit knowledge is what allows the interpreter to use and combine **contextual information** to “fill the blanks”.

Hyperknowledge Representation

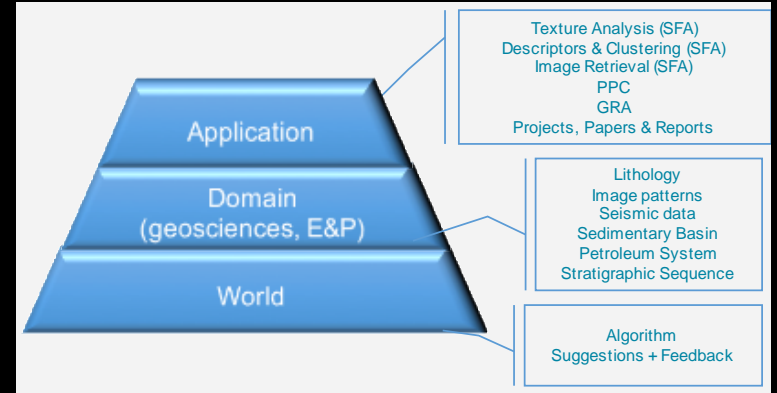

Extending the traditional knowledge representation techniques to connect concepts with multimodal content/representation

- Rich relationships between concepts and content segments
- Nested Context Model to structure knowledge graphs
- High-level abstractions for reuse of content and concepts
- Integration of formal knowledge and data-driven models

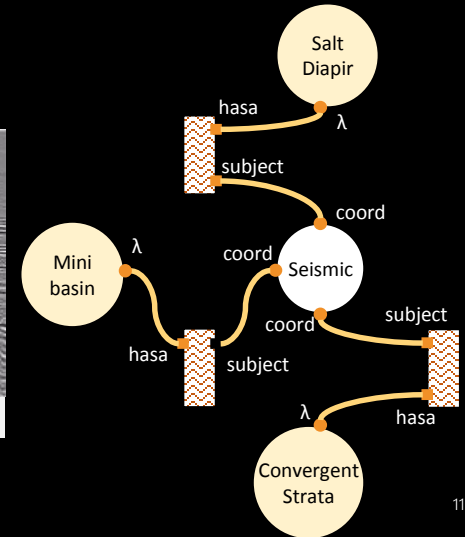

Example: Integrating and signifying ML models

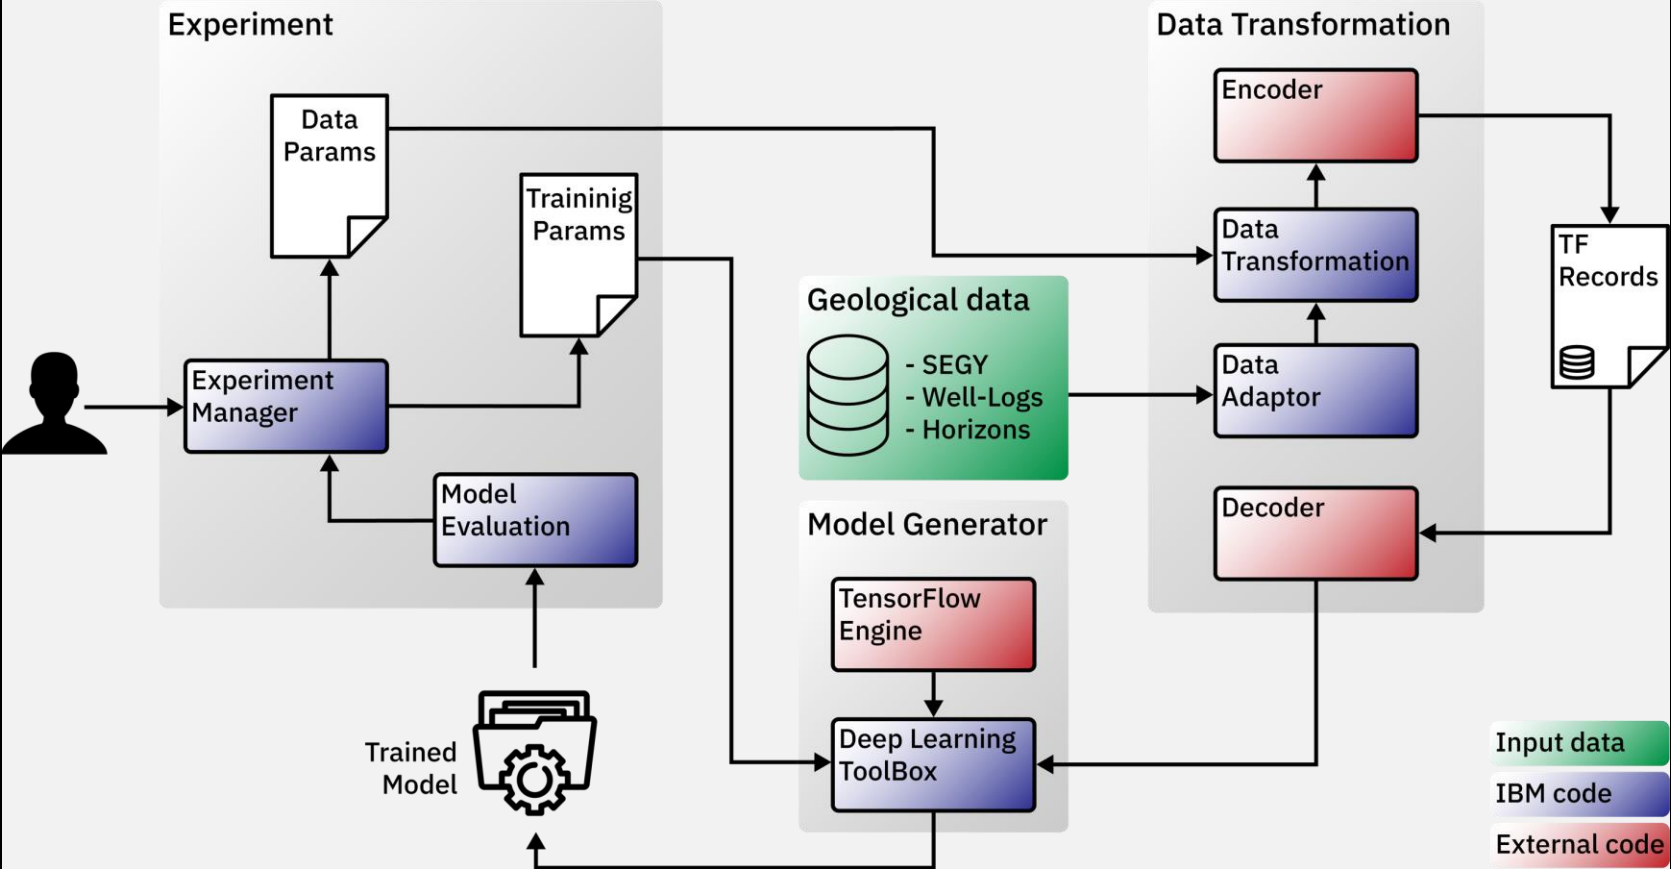

Ontology Engineering

Example: Signifying seismic images

AI for Natural Resources

Reimagining Industry (O&G and Mining) digital transformation with focus on data and knowledge intensive processes, such as subsurface exploration and production management.

Who we are

Machine Learning
Bianca Zadrozny

Machine learning and statistical modeling on geospatial data

Mathematical Optimization & Simulation
Leonardo Martins

Optimization under uncertainty, risk modeling, AI-driven model blending

Industrial Technology & Science
Mathias Bernhard Steiner

Nanotechnology for enhanced oil recovery

Knowledge Engineering
Marcio Moreno

Knowledge representation and reasoning, hybrid knowledge base architectures

AI-based Systems Engineering
Renato Cerqueira

Methods and technologies to support the lifecycle of AI-based systems

Visual Analytics & Comprehension
Rogério de Paula

Knowledge-augmented image comprehension, visual insights and perception

Industry Cloud
Marco Netto

HPCaaS, HPC for AI

Research Agenda

AI for Exploration & Production

- AI for Seismic
- AI for Wells
- AI for Asset Evaluation
- AI-assisted EOR

Industry Platform Technologies

- Hyperknowledge Base
- KB Lifecycle Management
- AI Workbench

Scientific Challenges

- Geospatial Temporal ML
- Knowledge R&R
- Knowledge-augmented ML
- AI for Models Composition & Orchestration
- Cognitive Interfaces (Explainable AI+Machine Teaching)
- Nanoscience
